

Worksheet 2: Primes

- Let $a, b \in \mathbb{Z}_{>0}$. Show that, if $g = \gcd(a, b)$ then $\gcd(\frac{a}{g}, \frac{b}{g}) = 1$.
- Give a careful definition of a *prime number*.
- Let $a, b, c \in \mathbb{Z}_{>0}$.
 - Prove that, if $a \mid bc$ and $\gcd(a, b) = 1$, then $a \mid c$.
 - Conclude that if p is prime and $p \mid ab$, then $p \mid a$ or $p \mid b$.
 - Give a counterexample that shows the previous sentence is wrong if p is not prime.
- Prove the *Fundamental Theorem of Arithmetic*: for every integer $n \geq 2$ there exist unique primes p_1, p_2, \dots, p_k and positive integers a_1, a_2, \dots, a_k such that

$$n = p_1^{a_1} p_2^{a_2} \cdots p_k^{a_k}.$$

- For existence, try induction on n .
 - For uniqueness, you may use 3(b).
- Andrews 2.4.5 & 6.
 - Experiment with the sage commands `factor` and `is_prime`. Try them with a 100-digit number and a 150-digit number and compare the four running times (e.g., by using `%time` before the command). What's going on here?
 - Preview: Clock Arithmetic*. The numbers on the 6-hour clock are the remainders we get when we divide by, in this case, 6. Adding 3 to 4 gets us to 1, which is also the remainder of dividing 3+4 by 6.

- Explain why the number at the top of the clock is 0 rather than 6.
- Complete the clock addition table and this clock multiplication table

+	0	1	2	3	4	5
0						
1						
2						
3						
4						
5						

$$\begin{array}{r}
 0 \\
 \cdot \\
 5 \cdot \quad \cdot 1 \\
 4 \cdot \quad \cdot 2 \\
 \quad \cdot 3
 \end{array}$$

·	0	1	2	3	4	5
0						
1						
2						
3						
4						
5						

- What patterns do you see in these two tables?
- Write down a precise statement for each definition we have given this week. For each definition, give an example and a non-example.
